

ABSTRACT OF THE DISCLOSURE

A method for positioning a cable in a recess behind a fixed structure, e.g. a storage bin, in an aircraft. A portion of the cable is enclosed in a conduit. Panels adjacent the structure are removed to partially expose the recess and at least one stringer. The conduit is directed into the recess from adjacent one end of the structure until the conduit passes another end of the structure, and the conduit is fastened to the stringer(s). The method provides an easy way to route cable behind a fixed structure without removing the structure and without having to make holes in the aircraft.
